

The dawn of the understanding of a new concept of pathophysiology, one that is essentially energetic in nature,
the Miasmatic Energetic Genetic Burden

Exogenous, endogenous and mixed factors compromise the genome and/or the immune system.

Comment

The Miasmatic Energetic Genetic Burden readily explains the diversity of disease expression, for the variation of miasmatic burden composition and predominant location is considerable.

Throughout life the area affected by the energetic miasmatic burden is gradually but steadily weakened and along with a growing compromise of the immune system ensures that disease expression finally results in what most probably shall prove to reveal itself of a very predictable character, a specific miasmatic pattern determining a specific disease.

Furthermore, the author surmises that the energetic miasmatic burden's location and the organ(s) that it predominantly encumbers or affects determine the individual's propensity to be beset by specific emotional themes, such that one readily finds the following relationships:

Pancreas - Grief

Kidney & Bladder - Forgiveness

Thyroid / Parathyroid / Liver / Gall Bladder - Anger

Lungs / Respiratory system - Survival

Lymphatics / Spleen - Apathy

Skin / Hypothalamus / Pineal Gland - Consciousness & Enthusiasm

Colon / Large Intestine - Letting go

Adrenals / Thymus - Fear

Pituitary - Pain

This observation would readily explain why it proved feasible for Hamer to identify and relate artefacts on brain CT-scans with the actual seat of disease.
